

Criterion A: Planning

The scenario

My client, Maria Musialik, is a retired nurse with several years of professional experience in the healthcare sector. Nowadays, she assumes the responsibility of managing her household and daily tasks independently.

Ms. Maria is characterized by her strong sense of organization. She takes great comfort in having a well-structured schedule for upcoming events and tasks, as it ensures her that nothing is overlooked.

Traditionally, Ms. Musialik used to rely on paper planners. However, she is no longer satisfied with them. Carrying a big notebook when she is coming out proves to be inconvenient. Furthermore, the act of transcribing recurring tasks on a daily basis, particularly those spanning an extended duration, consumes an unnecessary amount of her time. Additionally, her handwritten notes tend to be brief and lack the aesthetic appeal that she desires in her organizational tools.

Due to this fact, she asked me, Bartosz Bielawski, for help. After the interview with Ms. Maria, which is contained in the attached appendix, I proposed to create a “To do” application that will enable her to organize tasks more easily and efficiently. She will be able to use it on her phone freely.

Word count: 191

Rationale for the proposed solution

Having considered various options, I decided to develop an application using Android Studio, with Kotlin as the main programming language. Since Ms. Musialik is a forward-looking person and is aware of the possibilities smartphones can provide, using the application will not be a challenge for her but a solution to her problems.

This decision is mainly influenced by the fact that the end-user, Maria Musialik, uses an Android device, making Android Studio an optimal platform for achieving the objectives. Moreover, my research indicates that it is claimed to be the best Android development application. I personally find it to be an intuitive and manageable tool.

Another notable advantage of Android Studio is its versatility, allowing developers to write code in Java, Kotlin, and even C++. However, my inclination towards Kotlin stems from Google's endorsement of it as their preferred language since 2019. Additionally, when comparing Kotlin to Java, the former requires fewer lines of code, enhancing code readability and simplifying error identification, which is advantageous for me as a developer.

It is worth mentioning that I have limited prior experience with Kotlin. Nevertheless, I believe that with the help of online courses, I will rise to the challenge.

Word count: 198

Success criteria

- ☐ The application contains a logo
- ☐ A user can create a task
 - o A user can enter the name of a task
 - o A user can choose a category affiliation for a task
 - o A user can choose a type of task from:
 - Single task - repeated only once
 - Until task - repeated from one day to another until it is done
 - Repeat task - repeated every chosen day
 - o A user can choose a start day and a deadline for a task
 - o A user can enter the description of a task
 - o A task is saved
- ☐ A user can create a category
 - o A user can enter the name of a category
 - o A user can choose the colour of a category
 - o A category is saved
- ☐ Tasks can be displayed in a calendar
 - o Having clicked a day, all assigned to this day tasks appear
 - o The calendar presents a monthly view
 - o The starting position of the calendar is the current month
 - o A user can navigate to other months
- ☐ Tasks can be displayed in list form
 - o Tasks are grouped into categories
 - o Tasks are displayed in a colour based on their type
- ☐ Tasks can be deleted by a user
- ☐ Features of tasks can be edited
- ☐ Features of categories can be edited
- ☐ Categories can be deleted by a user
- ☐ There is a view of tasks assigned to the present day
- ☐ There is a view of tasks assigned to the present week
- ☐ There is an option to filter tasks based on the chosen features
- ☐ A task should be red and bolded in case of the coming deadline for it
- ☐ In case of an undone task after its deadline, it should become red
- ☐ The application does not archive done tasks (A finished task must be deleted)
- ☐ The design of the application is minimalistic and manageable
